Question 1 (3 marks)

You are choosing a main course at a restaurant, from a menu containing three items: bibimbap, haggis and manakish.

Suppose we have propositions B, H and M, with the following meanings.

B: You choose bibimbap.
H: You choose haggis.
M: You choose manakish.

Use B, H and M to write a proposition, in Conjunctive Normal Form, that is True precisely when you choose *either* the bibimbap *or* both the other items.

Question 2 (5 marks)

Suppose you have predicates `belongsToP` and `belongsToNP` with the following meanings, where variable X represents an arbitrary language:

`belongsToP(`X`):`   the language X belongs to the class P.
`belongsToNP(`

(a)   In the space below, write a statement in predicate logic with the me

P is a proper subset of NP (i.e., P $\subseteq$ NP a   )

To do this, you may only use: the above two predicates; quantifiers; logical connectives; equality. (In particular, you may not use $\subseteq$ or $\subset$ or $\neq$, etc, and in fact they would not help.)

(b) For the statement "P is a proper subset of NP", which one of the following holds? Circle (A), (B), (C) or (D) to indicate your answer.

(A)   The statement is True.
(B)   The statement is False.
(C)   It is not known whether it's True or False, but it's generally believed to be True.
(D)   It is not known whether it's True or False, but it's generally believed to be False.

Question 3   **(7 marks)**

A knob is used to select one of three positions A, B, C, as shown in the following diagram.
The position of the knob is recorded every second for some nonzero period of time.

The knob can never be turned from A to C, or from C to A, without spending at least one second in position B. The initial position of the knob can be any of A, B, C.

Consider the language of all possible strings of knob positions recorded in this way.

(a)   Give a regular expression for this language.

Assignment Project Exam Help

https://eduassistpro.github.io/

Add WeChat edu_assist_pro

(b)   Give a Finite Automaton for this language.

**Question 4** (5 marks)

Consider the following Generalised Nondeterministic Finite Automaton (GNFA). Construct an equivalent GNFA with the top state, q, removed.

Show your answer by writing in the four missing transition labels, on the dotted lines, in the second diagram below.
a

a

1

Question 5 (6 marks)

Consider the following Finite Automaton.

(a)   Which, if any, of the following strings are accepted by this FA? Circle the ones that are accepted.

ab   abbb   aabb   aabab

(b)   Consider the string aabab. Show that it can be split up into three parts xyz such that, for all $i \geq 0$, the string xy^iz is also accepted by the FA.

Do this by drawing vertical lines between the parts of the string given on the next line:

a a b a b

Question 6 (4 marks)

The following table describes part of a Finite Automaton with three states. The second row, for state 2, has not been filled in.

What could the state-2 row be, if you are given that the number of states of this FA is **not minimum**?

Write all possible state-2 rows in the second table below. Use as many rows as you need, one for each possible state-2 row. You may not need all the rows available.

	state	a	b
Start	1	2	3
	2		
Final	3	1	2

YOUR ANSWER:

state	a	b
2		
2		
2		

This question uses the following **Definitions** and **Facts**.

Definitions:

- If L is any language, the *reversal* of L is the set of all reversals of strings in L. In other words, you obtain the reversal of L by taking every string in L and writing it backwards. So, for example, the string abb becomes bba.

- If L is any language over the alphabet {a,b}, then the *interchange of* a *and* b forms a new language as follows: take every string in L, and replace every a by b and every b by a, simultaneously. So, for example, the string abb becomes baa.

Facts:

- The class of regular languages is closed under reversal.
- The class of regular languages is closed under interchange of a and b.
- The language AB := $\{\ a^n b^n\ :\ n \in \mathbb{N}\ \}$ is not regular.

Your task:

Using these facts, and any other closure properties of regular languages you like, *prove by contradiction* tha

is not regular.

Question 10 **(6 marks)**

This question uses the same Context-Free Grammar as the previous question. Here it is again for convenience:

$$S \;\to\; X \tag{1}$$
$$X \;\to\; \texttt{s}X\texttt{h} \tag{2}$$
$$X \;\to\; \varepsilon \tag{3}$$

Complete the following diagram to give a Pushdown Automaton for the language generated by this grammar.

Question 14 (10 marks)

The Venn diagram on the right shows several classes of languages. For each language (a)–(j) in the list below, indicate which classes it belongs to, and which it doesn't belong to, by placing its corresponding letter in the correct region of the diagram.

If a language does not belong to any of these classes, then place its letter above the top of the diagram.

You may assume that, when Turing machines are encoded as strings, this is done using the Code-Word Language (CWL), with input alphabet {a,b} and tape alphabet {a,b,#,Δ}.

(a) The set of all palindromes of even length.

(b) The set of all positive integers, in binary, whose number of bits is odd.

(c) The set of all strings of correctly matched parentheses.

(d) The set of all encodings of Turing machines that have at least three states.

(e) The set of all encodings of Turing machines that have at most three states.

(f) The set of all encodings of Turing machines that halt for some input.

(g) The set of all encodings of Turing machines that loop forever for all inputs.

(h) The set of all satisfiable Bo

(i) The set of all satisfiable Boole

Question 15 (6 marks)

If L is a language and s is a string, then $L\Delta s$ denotes the language formed by *removing s* from L if it is there already, and *adding s* to L otherwise. In other words,

$$L\Delta s := \left\{ \begin{array}{ll} L \setminus \{s\}, & \text{if } s \in L, \\ L \cup \{s\}, & \text{if } s \notin L. \end{array} \right.$$

Prove that L is decidable if and only if $L\Delta s$ is decidable.

Question 16 **(5 marks)**

Below is a proof that the Halting Problem is undecidable. But some parts are missing; these are shown as blank spaces, underlined.

Your task is to fill in the underlined spaces to complete the proof. In some cases, options are given in square brackets.

Proof. Assume that the Halting Problem is actually decidable.

Then the Halting Problem has a decider D.

Using D, we can construct a Turing machine E that does the following:

1. Input: encoding of a Turing machine M.
2. Run decider D to determine whether or not M halts when given itself as input.
3. **IF** the answer from D is **Yes**, then

4. **IF** the answe

Now consider what happens if E is given, as input, an encoding of *itself*.

If E halts on input E, then running D in line 2 gives the answer _____ [Yes/No].

So, using statement _____ [3 or 4], we see that D actually _____.

On the other hand,

if E does not halt on input E, then running D in line 2 gives the answer _____ [Yes/No].

So, using statement _____ [3 or 4], we see that D actually _____.

This is a contradiction.

So the Halting Problem must be undecidable.

Question 18 (13 marks)

A **perfect matching** in a graph G is a subset X of the edge set of G that meets each vertex exactly once. In other words, no two edges in X share a vertex, and each vertex of G is incident with exactly one edge in X.
The PERFECT MATCHING decision problem is as follows.

PERFECT MATCHING
Input: Graph G.
Question: Does G have a perfect matching?

For example, in the following graph, the edge set $\{a, e\}$ is a perfect matching. But $\{a, b, e\}$ is not a perfect matching (since, for example, a and b share a vertex), and $\{a\}$ is not a perfect matching (since some vertices are not incident with the edge in this set).

Let W be the above graph.

(a) Construct a Boolean expression E_W in Conjunctive Normal Form such that the satisfying truth assignments for E_W correspond to perfect matchings in the above graph W.

(b) Give a polynomial-time reduction from PERFECT MATCHING to SATISFIABILITY.

Assignment Project Exam Help

Prove that the GRAPH 4-COLOURABILITY problem is NP-complete, by reduction from GRAPH 3-COLOURABILITY. You may assume that GRAPH 3-COLOURABILITY is NP-complete.

Definitions:

For any positive integer k, a k-**colouring** in a graph G is an assignment of "colours" from the set $\{1, 2, \ldots, k\}$ to the vertices of G such that (a) each vertex gets exactly one colour from the set, and (b) adjacent vertices get different colours.

GRAPH 3-COLOURABILITY
Input: Graph G.
Question: Does G have a 3-colouring?

GRAPH 4-COLOURABILITY
Input: Graph G.
Question: Does G h
